

# BLOWGUN DRYSUIT INFLATION SYSTEM

The Blowgun Drysuit Inflation System is a compact, diver-focused upgrade that makes buoyancy control easier, more intuitive, and more versatile.

Built with a reliable Hanson-style quick-release connector and swivel valve body, it provides a secure, leak-resistant connection while allowing smooth movement underwater. The ergonomic push-button blowgun inflator delivers precise, responsive control and connects quickly to your drysuit valve for fast setup.

Its standout feature is versatility: with a quick disconnect, the blowgun can also inflate DSMBs, lift bags, and other equipment—reducing the need for extra tools and simplifying your dive kit.

Designed with accessibility in mind, the handheld inflator is easier to locate and operate than traditional chest-mounted valves, especially when wearing thick gloves, bulky gear, or diving in low visibility.

Reliable, practical, and easy to use, the Blowgun Drysuit Inflation System improves comfort, control, and efficiency for recreational, technical, and professional divers alike.
